## SUMMARY OF QUALIFICATIONS:

Full-Stack Engineer with 8+ years of experience in high-concurrency microservices, cloud infrastructure, and AI-assisted software delivery across fintech and media content streaming industries. Experienced with a number of common languages. High aptitude for learning new skills and honing old ones. Aspiring to further my career by obtaining a software development position in which I can utilize my knowledge and expertise to create a product I am passionate about.

## SKILLS:

- *Languages* - Fluent in Java, Python, JavaScript, and Golang. Experience with C#, Shell-scripting, Oracle and MySQL
- *AI* - Extensive experience with Claude, Copilot, Gemini, and ChatGPT
- *Tools/Technologies* - Experienced with Amazon Web Services, Packer, Docker, Terraform, Maven, Jenkins, Spring Framework/Spring Boot, Reactor, ReactJS, Bootstrap, GraphQL (and graphql-java), Redis, and more
- *Operating Systems* - Windows, Mac OS X, Linux/Unix, Android
- Extensive experience in Agile Kanban and Agile Scrum environments
- Considerable work experience on devops teams

## EXPERIENCE:

### *Capital One - Senior Associate Software Engineer*

*March 2025-Present*

- Architected and deployed resilient backend banking microservices on AWS for the Backend Account Servicing Team, streamlining critical workflows for account restrictions, recovery, and online account opening/closure.
- Integrated cloud-native backend APIs into customer-facing web portals, ensuring high security and seamless user onboarding.
- Leveraged GenAI workflows (Claude, Gemini, Copilot) to accelerate planning, API prototyping, test generation, and architectural design.

### *Independent Contractor*

*May 2024 - Present*

- Joined an ongoing startup as a Full-Stack Developer, contributing to key full-stack enhancements using React and C#. Implemented automated backend email workflows via customer.io in C# and engineered custom frontend features in React to allow users to capture and share their results seamlessly.
- Contributed heavily to a web-based job forum, bringing the UI closer to the vision the designers had, and added features to emphasize anonymity during the early job-search process

### *Comcast - Software Engineer III*

*April 2020-December 2024*

- Maintained two of the major services in the Xfinity X1 platform, which are responsible for determining which media a client has access to, resolving the client's content into a format which the set top box can interpret and display to the user, and storing the data using a robust distributed cache solution.
- After the acquisition of Sky, took the lead on implementation of an API that allowed Sky's metadata team to feed data into Comcast's primary metadata repository.
- Helped operationalize and optimize an existing GraphQL service, including making optimizations in Java, Reactor, and Redis.
- Worked on migrating logging in all services from Splunk to ELK

### *Comcast - Software Engineer II*

*September 2018-April 2020*

- Focused on improving image services (ingest, storage, resizing, and selection), image metadata services, and other metadata services on which the X1 platform relies, after helping move the sports metadata services to a dedicated team. Continued to support the legacy sports platform until customers migrated to the replacement services.
- Designed and implemented a UI for a service that allowed third-party image providers to upload individual images to individual media programs for the first time.
- Designed a similar service in which internal Comcast users could upload images and retrieve them by ID, resized if necessary. This differs from the previous bullet point because essentially it provided a lite version of the greater image service for users who did not need complicated image selection logic, or didn't want to have to go through associating images to various other entities within our platform in order to utilize our powerful image delivery services.

### *Computer Enterprises Inc - Junior Software Engineer*

*June 2017-September 2018*

- Worked at Comcast as a contractor. Helped expand sports images, and image metadata ingest systems.
- Added support for ingest of IPL and ICC cricket and all Olympic sports data in order for the X1 team to display these events in the Comcast Sports App. Also maintained and added functionality to existing metadata ingest flows.

**PROJECTS:**

- As a means of familiarizing myself with generative-AI, designed and wrote, with assistance from Gemini, a tool to practice a mechanically-challenging section of a Final Fantasy XIV boss fight in the browser
- In order to learn Golang, wrote an API which made calls to imagemagick and ffmpeg in order to create audio clips, video clips, and gifs from a given video file
- Wrote a Discord bot in Python3 which served memes and could play a few games
- Created an Android app which can determine the color value of a given photo, provide an approximate name of the color, and create a small complementary palette of colors
- Team Member on a Rules-Based Decision Engine project. Helped create a framework which aimed to accept data in any format and use the Drools rules engine to drive potentially any resultant action.

**EDUCATION:**

*Rowan University, Glassboro NJ*

*Fall 2014-Spring 2017*

Computer Science BS, Member of Tau Sigma National Honor Society.

3.53/4.00 GPA

Relevant Coursework: *Agile Software Engineering, Object-Oriented Programming, Data Structures,*

*Design and Analysis of Algorithms, Programming Languages, Operating Systems, Cyber Security, Principles of Network Security, Web Programming*
